Watchlist DoB Filter Function

Last updated: June 2024

Trulioo

Overview

This document provides an in-depth exploration of the date of birth filter feature and its functionality when enabled within the watchlist service configuration settings.

Trulioo

Watchlist Date of Birth Filter

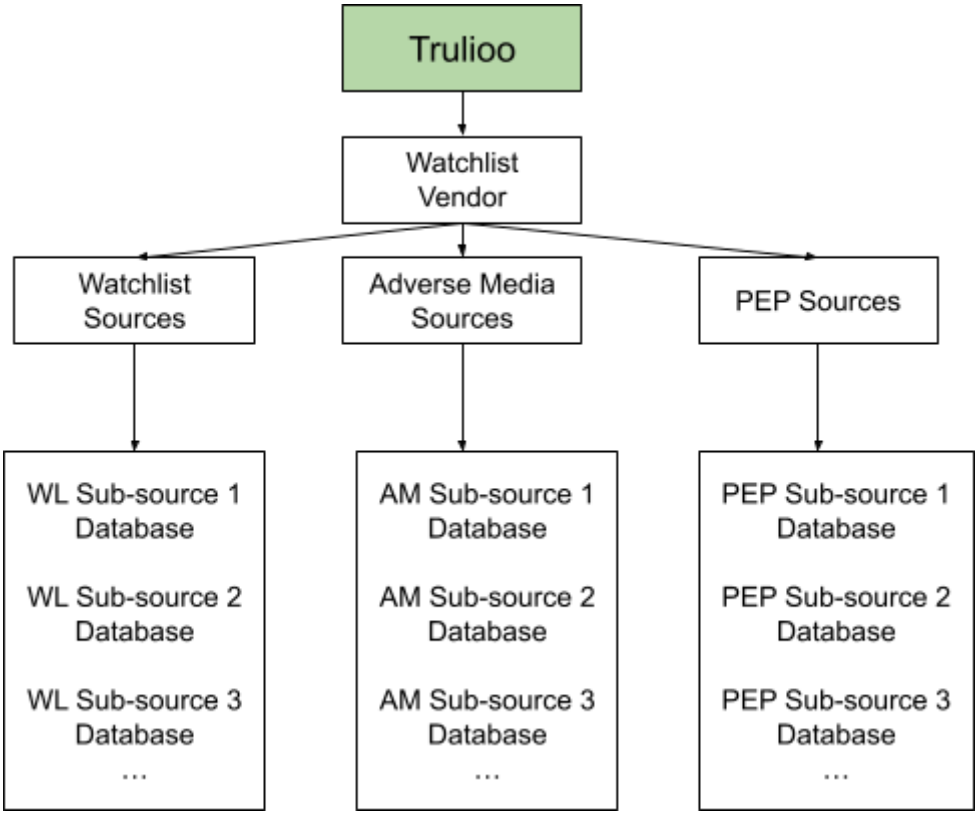
In the configuration credentials for the watchlist service, one of the filters Trulioo has control over is the date of birth filter. This filter can be toggled to either 'True' or 'False' and is exclusively available for **Person Match** and **Person Match Ongoing Monitoring** services. Now, let's delve into how this filter operates.

How DoB Filter Operates

When our customer or our customers' end-users provide their date of birth, our vendor receives this information and compares it with the data existing in their myriad of sub-sources. Our watchlist vendor targets thousands of these sub-sources, each with its own database.

Picture each database as a table of information. For the comparison to occur effectively, the submitted date of birth must exist in a separate column within each sub-source's database. Otherwise, the date of birth filter will not have data on which it can filter on.

It is vital to consider that the date of birth will not be extracted from the **article text** or **title** for the sub-sources.



Example:

Trulioo

Note: Please keep in mind that we will only send a Full DOB (A partial DOB will not be sent to the vendor).

Let's walk through an example where an end-user submitted the following information and we have 5 sub-sources that had some data:

- Name: John Doe
- Date of Birth: 1990/01/01

Sub-Source Number One:

Name	DoB
John Doe	1990/01/01

Result: This data would be returned as a potential hit and a link would appear in the results since DoB matches.

Sub-Source Number Two:

Name	DoB
John Doe	

Result: This data would be returned as a potential hit and a link would appear in the results since there's no DoB data available to disqualify it.

Sub-Source Number Three:

Name	DoB
John Doe	1992/02/02

Result: This result wouldn't be returned if the DoB filter was enabled.

Trulioo

Sub-Source Number Four:

Name	DoB
John Doe	1990

Result: Result: This data would be returned as a potential hit and a link would appear in the results since the available DoB data matches.

Sub-Source Number Five:

Name	DoB
John Doe	1992

Result: This result wouldn't be returned if the DoB filter was enabled.

Real Transaction Response

In the transaction below, the DoB filter in the configuration is enabled, and the end-user passes the DoB. However, they received a hit response with a different DoB in the text. As we explained, the date of birth will not be extracted from the **article text** or **title**s. Also, as you can see, the DoB does not exist in the sub-source data as a separate column.

FAQ

Question: Can our vendor normalize the DoB:

Answer: Regarding the normalization of DoB, our vendor indeed handles this task seamlessly. Even if the sub-sources employ varying formats for DoB, our vendor ensures to use a normalized version for a consistent comparison.

Different DoB formats can be for example:

- YYYY-MM-DD
- DD-MM-YYYY
- YYYY/MM/DD
- DD/MM/YYYY
- YYYY-DD-MM
- MM-DD-YYYY
- YYYY/DD/MM
- MM/DD/YYYY

Question: What will happen if the sub-sources have age instead of DoB?

Answer: The result from the sub-source will still be returned since the DoB filter needs the DoB in order to remove the result.

Question: How does the DoB filter work with the different PEP (Politically Exposed Person) types?

Answer: When an individual is found to match with a PEP (either by Name or by Alias) the DoB filter will still be applied and can remove an unwanted PEP hit due to the DoB difference. However, if an individual is found to match as a PEP's family member or associate, our partner doesn't have DoB data stored for those individuals linked with the PEP, thus if an associate/relative is matched, the hit will be returned referencing the PEP and their DoB that would be different then the provided value. To illustrate, if we continue the previous example:

Sub-Source Number Six:

Name	DoB	Associate
Joe Biden	11-20-1942	John Doe

Result: This result would return a PEP Type 2 (family/associate) result consisting of Joe Biden with a DoB of 11-20-1942 and indicating the PEP Relation as Relative/Associate.
